

ABSTRACT

A method for project development within an enterprise. The method can consist of gathering project related information from different sources and using the information to create reports. The reports can include information from more than one source. The information and the reports can be displayed for assessment in a graphical user interface providing access to a set of sub-graphical user interfaces. The displayed information and reports can be analyzed to monitor the progress of the project through the project development process. An end of a phase of the project development process can be determined and, upon the completion of a previous phase, an individual with responsibility for a next phase can be notified by automatically sending a message to the individual, informing the individual that the next phase can begin.
